Abstract

We show that if \mathbf{K} is closed under quasi-substructures then $\text{tp}(B/C)$ does not fork over $B \cap C$ if and only if B and C are free over $B \cap C$ and BC is closed for any closed $B, C \in \mathbf{K}$.

Our notations and definitions are standard (see [1], [5] for reference).

Let $L = \{R_0, R_1, \dots\}$ be a countable relational language, where each R_i is symmetric and irreflexive, i.e., if $\models R_i(\bar{a})$ then the elements of \bar{a} are without repetition and $\models R_i(\sigma(\bar{a}))$ for any permutation σ . Thus, for any L -structure A and R_i with arity n , R_i^A can be thought of as a set of n -element subsets of A .

For a finite L -structure A , a *predimension* of A is defined by $\delta(A) = |A| - \sum_i \alpha_i |R_i^A|$, where $0 < \alpha_i \leq 1$. Let $\delta(B/A)$ denote $\delta(BA) - \delta(A)$.

For $A \subset B$, A is *closed* in B (write $A \leq B$), if $\delta(X/A \cap X) \geq 0$ for any finite $X \subset B$. The *closure* A in B is defined by $\text{cl}_B(A) = \bigcap \{C : A \leq C \leq B\}$.

Let \mathbf{K}^* be the class of all finite L -structures A with $\delta(B) \geq 0$ for any $B \subset A$. Fix a subclass \mathbf{K} of \mathbf{K}^* that is closed under substructures. A countable L -structure M is *\mathbf{K} -generic*, if (i) any finite $A \subset M$ belongs to \mathbf{K} ; (ii) for any $A \leq B \in \mathbf{K}$ with $A \leq M$ there is $B' \cong_A B$ with $B' \leq M$.

Let \mathcal{M} be a big model of a \mathbf{K} -generic structure. Note that if \mathbf{K} -generic structure M is saturated then \mathcal{M} also satisfies (i) and (ii). We abbreviate $\text{cl}_{\mathcal{M}}(*)$ to $\text{cl}(*)$. \mathbf{K} has *finite closures*, if there is no chain $A_0 \subset A_1 \subset \dots$ of $A_i \in \mathbf{K}$ with $\delta(A_{i+1}/A_i) < 0$ for each $i \in \omega$. Note that \mathbf{K} has finite closures if and only if $\text{cl}(A)$ is finite for any finite $A \subset \mathcal{M}$.

For A, B, C with $B \cap C \subset A$, B and C are *free* over A (write $B \perp_A C$), if $R^{ABC} = R^{AB} \cup R^{AC}$ for every $R \in L$. Note that $B \perp_A C$ if and only if $\delta(\bar{b}/\bar{c}\bar{a}) = \delta(\bar{b}/\bar{a})$ for any $\bar{b} \in B - A, \bar{c} \in C - A$ and $\bar{a} \in A$.

Assumption L is a countable relational language. \mathbf{K} is a class of finite L -structure A with $\delta(B) \geq 0$ for any $B \subset A$. Moreover \mathbf{K} is closed under substructures and has finite closures. \mathcal{M} is a big model of a saturated \mathbf{K} -generic structure.

Definition Let A and B be L -structures. Then A is said to be a *quasi-substructure* of B , if the universe of A is contained in that of B , and R^A is contained in R^B for every $R \in L$. If L is a language of a graph, then the notion of quasi-substructures coincides with that of subgraphs.

For $A, B \subset \mathcal{M}$, we denote $B^{\text{Aut}(\mathcal{M}/A)} = \{\sigma(b) : b \in B, \sigma \in \text{Aut}(\mathcal{M}/A)\}$.

Lemma 1 Let $B, C \leq \mathcal{M}$ with $A = B \cap C$. Then $B^{\text{Aut}(\mathcal{M}/A)} = B$ implies $B \perp_A C$ and $BC \leq \mathcal{M}$.

Proof Since \mathbf{K} is closed under quasi-substructures, there is $B' \cong_A B$ with $B' \perp_A C$ and $B'C \in \mathbf{K}$. By genericity, we can assume that $(B' \leq) B'C \leq \mathcal{M}$. So we have $\text{tp}(B/A) = \text{tp}(B'/A)$. By $B^{\text{Aut}(\mathcal{M}/A)} = B$, we have $B = B'$ as a set. Hence $B \perp_A C$ and $BC \leq \mathcal{M}$.

For $A \leq B$, B is said to be *minimal* over A , if $C = A$ or $C = B$ for any $A \subset C \leq B$.

Lemma 2 Let $B, C \leq \mathcal{M}$ with $A = B \cap C$. If $\text{tp}(B/A)$ is algebraic then $B \perp_A C$ and $BC \leq \mathcal{M}$.

Proof We can assume that B is minimal over A . Since $\text{tp}(B/A)$ is algebraic, we can take a maximal set $(B =) B_1, \dots, B_n$ of conjugates of B over A satisfying $B_i \neq B_j$ as a set for each i, j with $1 \leq i < j \leq n$. By minimality, we have $B_i \cap B_j = A$.

Claim: $\perp\{B_i\}_i$ and $B_1 \dots B_n \leq \mathcal{M}$.

Proof: Since \mathbf{K} is closed under quasi-substructures, for each i there is a copy B'_i of B_i over A with $\perp\{B'_i\}_i$ and $(A \leq) B'_1 \dots B'_n \in \mathbf{K}$. We can assume that

$B'_1 \dots B'_n \leq \mathcal{M}$. By maximality of n , we have $B_1 \dots B_n = B'_1 \dots B'_n$ as a set. Hence $\perp \{B_i\}_i$ and $B_1 \dots B_n \leq \mathcal{M}$.

We devide into two cases.

Case: There is i with $B_i \subset C$. By claim, $BB_i \leq \mathcal{M}$. By induction hypothesis, we have $B \perp_{B_i} C$ and $BB_i C = BC \leq \mathcal{M}$. Again, by claim, $B \perp_A B_i$, and hence $B \perp_A C$.

Case: For any i , $B_i \not\subset C$. By minimality, we have $B_i \cap C = A$. Let $B^* = B_1 \dots B_n$. Then $B^{*\text{Aut}(\mathcal{M}/A)} = B^*$. By lemma, $B \perp_A B_i$, and hence $B \perp_A C$.

The following fact is due to Wagner [5]. Recently, Tsuboi [4] gave a short proof of this fact.

Fact 3 Let $B, C \leq \mathcal{M}$ with $A = B \cap C$ algebraically closed. Then $B \downarrow_A C$ iff $B \perp_A C$ and $BC \leq \mathcal{M}$.

The following theorem is a generalization of results obtained in [1] and [3].

Theorem Let \mathbf{K} be closed under quasi-substructures. Let $B, C \leq \mathcal{M}$ with $A = B \cap C$. Then $B \downarrow_A C$ if and only if $B \perp_A C$ and $BC \leq \mathcal{M}$.

Proof (\Rightarrow) Suppose that $B \downarrow_A C$. First we show $B \perp_A C$. Let $B' = \text{acl}(A) \cap B$ and $C' = \text{acl}(A) \cap C$. By lemma 2, $B \cup \text{acl}(A), C \cup \text{acl}(A) \leq \mathcal{M}$. So, by fact 3, $B \perp_{\text{acl}(A)} C$. By lemma 2, $B \perp_{B'} \text{acl}(C)$. So $B \perp_{B'} C$. Again, by lemma 2, $B' \perp_A C$. Hence $B \perp_A C$. Next we show $BC \leq \mathcal{M}$. By lemma 2, $BC \cup \text{acl}(A) \leq \mathcal{M}$. So it is enough to show that $BC \cap X \leq X$ for any finite $X \leq BC \cup \text{acl}(A)$. For $D \subset \mathcal{M}$ let X_D denote $X \cap D$. Take any $\bar{e} \in X - X_B X_C$. By lemma 2, we have $B' C \leq \mathcal{M}$, and so $X_{B'} X_C \leq \mathcal{M}$. By lemma 2 and fact 3, we have $B \perp_{B'} \text{acl}(A)$ and $B \perp_{\text{acl}(A)} C$, and so $X_B \perp_{X_{B'}} \bar{e} X_{C'}$ and $X_B \perp_{\bar{e} X_{B'} X_{C'}} X_C$. Therefore

$$\begin{aligned} \delta(\bar{e}/X_B X_C) &= \delta(\bar{e}/X_{B'} X_C) + \delta(X_B/\bar{e} X_{B'} X_C) - \delta(X_B/X_{B'} X_C) \\ &\geq \delta(X_B/\bar{e} X_{B'} X_C) - \delta(X_B/X_{B'} X_C) \\ &= \delta(X_B/\bar{e} X_{B'} X_{C'}) - \delta(X_B/X_{B'} X_{C'}) \\ &= \delta(X_B/X_{B'} X_{C'}) - \delta(X_B/X_{B'} X_{C'}) = 0. \end{aligned}$$

Hence $X_B X_C \leq X$.

(\Leftarrow) Suppose that $B \perp_A C$ and $BC \leq \mathcal{M}$. Take B' with $B' \downarrow_A C$ and $\text{tp}(B'/A) =$

$\text{tp}(B/A)$. By the only-if part of this theorem, we have $B' \perp_A C$ and $B'C \leq \mathcal{M}$. Thus we have $\text{tp}(B'/C) = \text{tp}(B/C)$ and hence $B \downarrow_A C$.
